SUB CODE: 03

ABSTRACT: A study has been made of the cathode scattering of dust particles in the earth's proton radiation belt and it is demonstrated that this effect considerably limits the lifetime of particles trapped by the earth. The author evaluates the role of the solar wind in decreasing the eccentricity of the orbits of dust particles revolving around the sun and it is demonstrated that the effect of the solar wind is comparable to the effect of light radiation. It is shown that allowance for corpuscular radiation is entirely necessary in estimating the lifetime of trapped micrometeorites. The lifetime of the particles relative to cathod scattering in the proton radiation belt is extremely small and it therefore is probable that the high concentration of dust particles near the earth is not caused by capture but by the curvature of the orbits of micrometeorites with hyperbolic (relative to the earth) velocities. ABSTRACT: It is shown that the basic mechanism responsible for acceleration of electrons and protons in the outer zone of the radiation belts surrounding our planet as well as for formation of the inner belt, is particle migration across the drift envelopes. The general theory for this particle migration is presented and experimental data are interpreted. It is found that the migration process has a much greater effect than had been previously supposed. Part of the protons with energies of 10-100 Mev are accelerated by migration of particles through the magnetosphere. Experimental analysis indicates that protons with energies greater than

Card 1/2

L 1284-66

ACCESSION NR: AT5023600

50-60 Mev are caused by neutron decay and elution due to anomalous diffusion. Protons with energies of less than 20-30 Mev, and in part those of 40 Mev are not basically associated with neutron decay. These particles are the hard tail of the outer proton belt, and are chiefly the result of betatron acceleration during migration across the boundary of the magnetosphere. It is possible that anomalous diffusion also plays some part in formation of the current ring during magnetic storms. Orig. art. has: 3 figures, 16 formulas. [14]

Effect of thiourea on metamorphosis of tailless amphibia. M. G. Zaks and G. B. Tverskoi (Leningrad State Pediat. Med. Inst.). *Fiziol. Zhur. S.S.S.R. (J. Physiol.)* 33, 233-44(1947).—Tadpoles of *Rana temporaria* were subjected to thiourea at various stages of development as well as under metamorphosis induced by thyroxine. Keeping tadpoles in 0.033% thiourea soln. for 7 days resulted in definite retardation of tail growth, with especial effect at the end of metamorphosis (tail resorption). These specimens on immersion in pure water completed their metamorphosis within 8 days; those left in thiourea soln. remained immature. Growth retardation was very pronounced in young specimens in early growth stages. If thyroxine (10^{-7} soln.) is added to the medium after the thiourea effect becomes apparent (12 days), the metamorphosis is accelerated in both test and control groups, with the test group showing a much more pronounced stimulation of growth, as well as the higher lethal percentage. Thus, thiourea enhances the thyroxine effect.

Title : Use of cannula in systematic experiments to determine the activity of the mammary gland

Periodical : Fiziol.zhur. 2, 233-235, Mar/Apr 1954

Abstract : A method of bloodless passage into the mammary glands of goats by insertion of a cannula, 1.4 millimeters in diameter, into the opening in the teat is described. This cannula is made of a lightweight metal, Duralumin, is held in place by a band around a rubber cap clamped on the teat. Cannula does not cause reduction of milk yield and no inflammation of the teat was noted even after cannula was kept open as long as 2 1/2 months. If mastitis is absent cannula may be inserted under aseptic conditions. A cannula somewhat larger in diameter may be used in experiments on cows. One USSR reference. Illustrations.

TITLE:

Milk Secretion in She-Goats Subjected to Total Spinal Cord Cutting (Sekretsiya moloka u koz posle polnoy pererezki spinnogo mozga)

PERIODICAL:

Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 6, pp 1137 - 1139 (USSR)

ABSTRACT:

The hormones of the anterior pituitary play an important part in the stimulation of the milk secretion (Ref 1). The influence of these hormones upon the maintenance of the secretory process is evident, whereas the ways of the regulation of the hormone producing activity of the anterior hypophysis are in many regards not yet clear. There are some facts which suggest the importance of afferent impulses on the part of the mammary gland in this regulation (Refs 2-5). This afferent impulsion, however, is not the only source of stimulation of the hormone production. It was repeatedly proved that the milk production proceeds also without afferent influences by the mammary gland (Refs 6-8). The author intends to check the results of Tsakhayev (Ref 10)

Card 1/3

Milk Secretion in She-Goats Subjected to Total Spinal
Cord Cutting

SOV/20-123-6-49/50

that are in contradiction with those of other investigators. For this purpose he used 6 goats of Mauchno-opytnaya stantsya (Scientific Experimental Station) of the institute mentioned in the Association. Modification I: The spinal cord of 3 goats was cut immediately after the first birth, still before the first milking. Modification II: The spinal cord of the remaining 3 goats was cut at D_{XI} during the period of lactation. A complete cutting of the spinal cord causes a disturbance of the milk secretion reflex and a retention of milk within the alveolar section of the gland. The milk secretion after the cutting of the spinal cord is illustrated in tables 1-3. It can be seen from them that the cutting does not interrupt the process of milk production. It may be concluded from the experimental results that the intactness of the afferent tracts of the spinal cord is not necessary for maintaining a high level of milk production. It was not the purpose of this paper to investigate the milk secretion under the highest possible elimination of the afferent impulses on the part of the mammary gland. This was done in another paper by the

Card 2/3

Milk Secretion in She-Goats Subjected to Total Spinal Cord Cutting SOV/20-123-6-49/50

author (Ref 8). The importance of the impulses mentioned cannot be denied but in addition to them there must exist other ways of regulation of the anterior pituitary function which maintains the milk secretion (Ref 8). Ye. Ya. Gilinskiy assisted in the evaluation of the data of the histological analysis. There are 3 tables and 14 references, 4 of which are Soviet.

AUTHORS: Mayevskiy, V.Ya., Chief Engineer, and I.Sh. Tverskoy, Chief of the Planning and Estimating Bureau

TITLE: What Stands in the Way of Bulk Plant Reconstruction (Ponekhi rekonstruktsii neftebaz)

PERIODICAL: Neftyanik, 1959, Nr 2, p 28 (USSR)

ABSTRACT: The expected rise in the Soviet petroleum production calls for an immediate expansion of presently operating bulk plants and for the construction of new bulk plants. The distance between bulk plant installations as well as between residential and recreational buildings, according to the old regulations (OST 90039-39), was 50 meters, and this procedure was followed for a number of years. In October 1956 new regulations increased this distance to 100 meters. However, this provision was enforced only for bulk plants and terminals under reconstruction. Old installations which are not rebuilt are allowed to remain unchanged. These new regulations hinder bulk plant reconstruction. The space left free, according to these new regulations, was supposed to be measured not from the bulk plant limit but from such bulk plant installations as storage tanks, gasoline filling stations, etc. Moreover, new petroleum bulk plants, being built far from populated centers, are now being constructed without taking into account

1/2

What stands in the Way (Cont.)

SOV/92-59-2-28/40

possible future expansion. It is evident that regulations prescribing open area should be based on the principle of measuring from the bulk plant limit and not the bulk plant installations. While the bulk plants operating at present are usually built at a distance of 50 meters from the railroad station, the new regulation (TU 103-56) provides that this distance be increased to 80 meters. It is therefore clear that the Gosstroy of USSR (State Committee on Construction of the Council of Ministers of the USSR) has to revise the regulations and provisions which are now in force for bulk plants and terminals. This must be done in order to facilitate their reconstruction.

TITLE: A Floating Roof Preserves the Petroleum Product Quality
(Plavayushchaya krysha sokhranyayet kachestvo nefteprodukta)

PERIODICAL: Neftyanik, 1958, Nr 10, pp 17-18 (USSR)

ABSTRACT: According to this article a floating roof of a storage tank can limit losses of light fractions of the petroleum product stored in the tank, and consequently can preserve its quality. For this reason Ukrainian bulk plants started to use storage tanks with floating roofs long ago. The roof of such a tank is built of prefabricated sections, assembled at the storage site, and is provided with peripheral, annular sectional pontoons and a central pontoon. A special cover plate (Fig. 1) connects the various pontoon sections. The column of the tank runs through the central pontoon. The most important part in the structure is the roof closure (Fig. 2) consisting of two belts covered with rubber and a polyvenyl chloride film inserted between them. A clearance of

Card 1/2

Ekonomika transporta (The Economics of Transportation) 2d rev.
ed. Moscow, Transzheldorizdat, 1957. 711 p. 30,000 copies
printed.

Ed.: Krishtal', L.I.; Tech. ed.: Khitrov, P.A.

PURPOSE: This textbook is intended for students in engineering-
economic branches of Railway Transportation Institutes, as well
as for railway workers engaged in the independent study of railway
economics.

COVERAGE: The economic aspects of railway transportation are dis-
cussed in this textbook. It covers such subjects as technical-
economic problems, the most efficient way to use available
facilities, methods for planning and organizaing various branches

of transportation operations and production, wages, costs, finances, and business accountability (khozraschet). For detailed information see Table of Contents. The book is written by several specialists in the field of railway transportation: Chapters I and IV, and part 1 of chapter II are written by Prof. S.K. Danilov; Ch. II, (parts 2, 3, and 4) is written by D.I. Chernomordik, Doctor of Economic Sciences; Ch. III by Docent A.I. Korneyev; Chapters V, VII, and VIII by Prof. Ye. D. Khanukov, Doctor of Economic Sciences; Chapters VI and XIV by Docent K.N. Tverskoy, Candidate of Economic Sciences; Ch. IX by V.I. Dmitriev, Candidate of Economic Sciences; Ch. X by Prof. A. Ye. Gibshman, Doctor of Technical Sciences; Ch. XI by Docent V.E. Umbliy, Candidate of Economic Sciences (deceased), revised by Prof. S.K. Danilov; Ch. XII by Docent A.S. Chudov, Candidate of Technical Sciences; Ch. XIII by Docent N.S. Shil'nikov, Candidate of Economic Sciences. There are 24 pages of references (pp. 682 through 705). Pages 682 to the middle of 694 are devoted exclusively to references from the works of Marx, Engels, and Lenin.

Preservation of blood with sulfanilamide. L. M. Tverskoi. *Khirurgiya* 1946. No. 1, 15-17. Blood preserved with 0.5% citrate and 0.8% sulfanilamide can be kept at -10 to 4° a max. of 27 days; the same result is obtained with omission of sulfanilamide. The osmotic resistance of blood preserved with citrate and sulfanilamide drops after the 4th day and very intense lowering occurs at 9-10 days, reaching a max. at 12 days; no actual hemolysis was observed. Sulfanilamide-preserved blood does not have bactericidal or bacteriostatic properties against streptococcus or staphylococcus, nor does this treatment prevent the invasion of the blood by atm. flora. Sulfanilamide blood had no therapeutic effects in 232 transfusions.

The direct action of some chemical compounds on the spores of *Plasmiodiophora brassicae*. D. L. Tyerski. *Plant Protection* (U. S. S. R.) 1936, No. 9, 137-40. The use of *N* concns. of MgSO₄, Na₂CO₃, CaCl₂, LiClO₄, Sr(NO₃)₂, NaOH, KOH, Ca(OH)₂, Ba(OAc)₂, K₂H₂PO₄, HCl, H₃PO₄, and (NH₄)₂CO₃ in the control of *Plasmiodiophora brassicae* on cabbage led to infections of 80.90, 84.5, 72.4, 91.8, 86.3, 84.9, 94.4, 85.6, 90.6, 95.9, 92.8, 45.5 and 90.2%, respectively. Controls showed 100% infection. In 10 *N* concns. the percentage infection varied from 89.2% for CaCl₂ to 99.6% for KOH. The most effective reagents were H₃PO₄, MgSO₄, and CaCl₂. S. A. K.

ASB-55A METALLURGICAL LITERATURE CLASSIFICATION

(natural, agar, or salt solutions) under the influence of irradiation, but not when the heat effect was eliminated by water jackets. *In vitro* the micro-organisms were killed at temperatures inside the test-tubes from 45° to 60° C. or higher, the inference being that the temperatures of the substrata were much lower than those developed inside the micro-organisms themselves by the waves. With *E. carotovora* it was also observed that the killing effect was more rapid as the density of the suspensions was greater, but was nil when silk threads dipped in a suspension of the bacteria and dried were directly irradiated. The organism was killed most rapidly when present inside cereal grains.

These results are interpreted as indicating the possibility of using short and ultra-short radio waves for the disinfection of wheat seed-grain infected with loose smut [*Ustilago tritici*], or with *Helminthosporium* and *Fusarium* spp., there being evidence that by increasing the potential of the electrical field, the sterilization of the affected grain may apparently be attained within a very short time (a few seconds). It was further found that exposure of wheat grain in an electrical field to a temperature of 65° C. for two to four minutes only slightly reduced its germinability. Further work is in hand to test the possibilities of this method.

Турьяков (D. L.), Жукова (Мме К. Р.), & Навайтц (B. S.). Причины
выпадения сеянцев Клевера в Московской области и меры борьбы с ними.
[Causes of Clover seedling failures in the Moscow district and control measures.]
— *C. R. Acad. Sci. agric. U.R.S.S.*, 1950, 5, pp. 22-29, 1950.

In 1947 clover failure in the Moscow district amounted to more than 80 per cent. In 1949 in the drier southern areas of the district 18 per cent. of the seedlings were diseased, and 85 per cent. in the more humid northern parts. At the Sukhanovo State farm 27 per cent. of the diseased seedlings died and 45 per cent. at the Moscow Experimental Station, Ermolino, the losses being greatest during a hot, dry period in June and July.

In investigations carried out in 1949 at the Moscow Experimental Station a species of *Fusarium* [cf. *R.A.M.*, 25, p. 13; 26, p. 110] was most frequently isolated from diseased red clover seedlings, followed by species of *Rhizoctonia* [ibid., 19, p. 322] and *Pythium*. *Thielaviopsis* sp. [ibid., 27, p. 123] was less common. Many seedlings had infected root systems (11 to 45 per cent.); isolations yielded *Fusarium* in 32.6 per cent. of the cases and an [unspecified] bacterium in 53.8

TITLE

Freezing of Drops of the Supercooled Water Fog in the Accoustic Field.

(Zamerzaniye kapel' pereokhlazhdenного vodyanogo тумана v akusticheskom pole - Russian)

PERIODICAL

Zhurnal Tekhn.Fiz., 1957, Vol 27, Nr 8, pp 1826-1829 (U.S.S.R.)

ABSTRACT

The conditions under which deep-cooled water in small quantities and especially in form of drops freezes, and the influence of strong vibrations (shocks) on these deep-cooled drops were investigated. From literature we know the case that the formation of ice-crystals was observed with deep-cooled river-fog in the beam of the searchlight of a car which had stopped on the bank when a strong accoustic signal exercised its influence on it. Experiments were carried out in a 24.10^4 cbcm chamber with super cooled water-fog in order to investigate this phenomenon. The accoustic oscillations were caused by a siren. The experiments showed that a fast crystallization of the supercooled fog took place in the accoustic field with an intensity of 3.10^2 Erg.cm⁻².sec.⁻¹. The whole process lasted for about one minute and a crystallization was not observed without the influence of the accoustic oscillations on the fog. Experiments with various negative temperatures showed that the supercooled fog crystallizes quicker within the range of from -4 to -50C. The intensity of sound is, of course, decisive in this process.

ABSTRACT: More than 350 experiments conducted in the cold chamber at the Main Geo-physical Observatory to determine the effect of sound at frequencies 100-1000 Hz and 3500 cps on the dissipation of fog showed that the rate of crystallization and
crystallization and accelerate the dissipation of fog by a factor of 2-3 when water content to retard the onset of crystallization but accelerate subsequent dissipation. Thus, when the water content was increased from 2 to 10 g/m³, crystallization
